Messrs. Editors,

If you think with me on the following subjects, you are at liberty to give publicity to the little thing following.

A SUBSCRIBER.

OUR CURRENCY.

NUMBER 1.

Thus we take into view the many difficulties that arise from the controlled state our monied institutions appear to be placed in, we must acknowledge that it is very discouraging, and produces much embarrassment in every description of trade. The causes which have led to this state of things are obvious: the same principles have operated in every state in the union, and from that speculative principle which has spread equal to contagion, through all ranks in society, excessive issues of paper have been made upon security little more than nominal in not a few instances, and loss must be sustained. It will be seen by referring to the official report of the Bank of Vincennes, made on the 17th November, 1820, that the institution owed $545,000. That, they had the following provisions to discharge that amount of debt:

Of notes on A, B, and C, to the amount of about 200,000 dollars;

Debt of the State to the Bank, 22,000 dollars;

In specie, 33,000 dollars;

Notes on common Banks to the amount of 26,000 dollars;

Deposited in different Banks 17,000 dollars;

Brookville, Corydon, and Vevay branches 256,000 dollars! dollars! dollars!!!

Who can be so ignorant of the state of affairs, as to cry out hard times, and no money, while the vaults of those money shops are filled with ready cash! Let us now proceed to examine those several items in order to find out to what they amount, and not raise the cry of fire when there is even no smoke. Notes discounted. Some of them will be paid in time, and some notes the Bank will have, if they never get the amount, &c. The nature of business has changed in some measure since those notes were discounted, and real estate has fallen as rapidly in price, as it was raised by speculation. Many persons will find it difficult to convert their property into cash, even at a great sacrifice; and if prospects for the trade with foreign ports continue as they now are, the difficulties are not felt yet, except in a very slight degree. In the second place, the loan to the State is good, that is, the State is good for that amount, but in what will it be paid? I reply, in its own paper! —Thirdly: Specie—since that period it is reported from the most respectable source, that, there is no specie of account to be found, and a positive refusal on the part of the Bank to give any satisfactory account of it whatever: "I'll meet thee at Philippi."

Notes on foreign Banks comes next in order. Let me ask what Banks they are on? And next, they have deposited in their office at Brookville $91,687. In Corydon Branch $75,774; and in Vevay Branch, $71,785. What is all this money made of? specie, U. States' paper, or eastern or southern paper? no—none of this. What then, says the enquirer? I will answer for his information, it is in printed promises with pictures about 'em!! Those Branches did not receive specie from the mother Bank, nor can they possibly be accountable to that Bank for specie or its equivalent: they have it not to pay.

Here then we see the source from whence $545,000 is to be paid! What has become of the capital stock, $120,000, and the United States Treasury Deposit of $215,000? Can the public receive no satisfactory answer? The Bank of Vincennes cannot stare the public in the face, and say, we are innocent—attach no blame to us.

JOHN C. SYMMES

Addresses himself to any who may deny that his Theory of the Earth is well founded, and asks them, to shew to the advocates of the Theory, wherein it is erroneous; and to offer any other theory, either old or new, which will better agree with the facts, phenomena and occurrences which have been cited in support of it. For example, How the principle contained in his Memoir, No. II. founded on the known or acknowledged loss of gravity, may be explained? Why Saturn is seen surrounded by a concentric circle or ring, which if not solid matter, at least, be liquid? Why the mammoth, quadrupeds & water fowl about Hudson's Bay, go northwardly in autumn, and return from the same course in the spring? Why certain rivers found by Hearne and Mackenzie (who were thirteen months travelling to and from the verge without being sensible of it) were so remarkably broad & deep as they are described to be?* Why none of the Indians Hearne saw, had ever heard of any sea to the westward? Why those Indians represent the country farther to the west or south west was so warm as never to have any frost or snow? Why the Esquimaux Indians at Coppermine river, have goods such as the dames of Greenland sell, and none such as the British sell at Hudson's Bay? Why Mechemo-be, the Indian chief who was Hearne's guide from Hudson's Bay, pointed out Coppermine river as lying north and running an eastwardly course, whilst Hearne makes it lie north west and run north? Why the variation described by capt. Parry, as lately published, corroborates the meridians long since marked on the before mentioned wooden hemisphere.†

Let any who may deny the Theory to be *well founded*, answer all, or at least, some of the many arguments offered in support of it, before they undertake to pronounce it baseless. And if the author and his advocates are to be charged with defending an absurd position, let them be questioned in a court of argument, and judged by the word after a hearing pro & con.

It is held by the author that the theory is a pious one; that there is nothing ignoble in it; that it is simple, and so well supported by principle and by facts, that its supporters have nothing to fear from any sort of test that can be applied to it.

The author is charged with over-doing the matter, by being too enthusiastic; and is told that it would be better policy not to take such high ground at first, but dispense with concentric spheres for the present, and maintain only one sphere, &c. The reply is, that he does reserve some of his conclusions to be ripened by further reflection; others, however, though too new to be readily admitted by the world are necessary to exemplify with due consistency the first principles of the theory, such for example is that of concentric spheres.

Now is the time for America to shew her enterprize. The difficulty of getting as far north as Baffin, Ross, or Parry went, is as nothing: from thence an armed force of one or two hundred men, could travel with hand sledges on the snow and ice, as Hearne did, and as they return from the wood land country in the spring, haul, as he did, light back canoes to cross the rivers and lakes, which open at the season before the snow disappears.

As certainly as this new theory is true and Hearne an honest journalist, so certainly could the party soon reach that country of abundant game which Hearne describes; in travelling through which, he did not complain of cold, although he travelled all winter, and had many Indian women in company.

There appears to be this advantage in making the trip in winter (in case the ships cannot pass the ice northward in September) that the waters are then all bridged with ice, although the cold is not excessive; this is most probably owing to the centrifugal action produced in the concave, by the rotation of the earth operating so as to increase or aid the gravity acting on the molecules of water; hence they may be formed and preserved in a fixed state, under a less degree of cold than is requisite for a like fixation here, the elastic molecules of quicksilver must be reduced by the same law; therefore, the cold there can, at present, only be tested by feeling, and not by the thermometer; hence it is accountable why Parry's crew hunted in winter, when the average of the thermometer was below zero, and why at that season they were only driven under deck when the winds blew hard; and why Hearne could sleep without fire, by only digging a hole in the snow, down to the moss, and lying with his sledge set up edgewise to windward.

The same law should, continually, or generally, reduce the elastic molecules of the atmosphere there, and hence set free heat therefrom; & thus by the reduction produce a flow of air from without toward the interior, which would be *an apparently* northerly wind, every where beyond the brow of the verge.

Doubtless the south polar opening would afford at its lower part opposite New Holland, a more certain passage by water than can be expected in the north. Indeed it would be well to equip two expeditions—one for the north and the other for the south. And we should lose no time, lest the maritime nations of Europe outdo us in the enterprise.

Lexington, March 14th, 1821.

☞ The author is impelled by his feelings, to acknowledge and boast the attention, both general and *special*, which he has experienced while lecturing on his new theory in Lexington.

* The former states, that the grand Athapuscow river is two miles broad with lofty banks one hundred feet above the ordinary surface of the water; the depth of the river not ascertained. And the latter describes the river he descended, as being 500 feet deep and a very rapid and long river, with several large rivers coming into it. West, where Hearne went, must have been in a direction tending toward the concave equator: and at right angles with the oblique meridians marked on the wooden hemisphere shown in the lecture room. Both those travellers describe very large trees, and mention the country as being amply inhabited by men and quadrupeds.

† It is thought capt. Parry should have sailed southwardly from the extremity of the verge TOWARD THE CONCAVE EQUATOR, down Prince Regent or some other southerly inlet, where it is probable he would have found a passage thro' the ice, especially if he waited sufficently late in August or September; and on not succeeding in getting through, he might have proceeded on the ice during the winter, as Hearne did; for Parry, as well as Davis, Baffin and Ross, were doubtless beyond the snow of the verge, after they passed that line where the needle varied ninety degrees.

From the London Observer.

Important.—The peculiar property of the Colchicum seeds in allaying irritation of the windpipe, lungs, &c. and thereby removing the causes of asthma and consumption, is the greatest discovery that has been made in medicine. It appears, by the last number of the Monthly Gazette of Health, that a few doses of the syrup will effectually remove the symptoms of asthma; and arrest incipient consumption, and in a few days it will restore the patient to health; and that the wine of the seeds, combined an alkali, as speedily cures gout and rheumatism. So extraordinary has been the salutary effects of these new remedies in those diseases, that the editors do not hesitate to pronounce them specifics. The other information this popular, medical, dietetic, and philosophical journal contains, particularly the exposition of literary quackery, compositions of nostrums, and disgraceful practices of certain practitioners, &c. will become highly interesting.

On the operation of Stop-Laws.

Cleaveland (Ohio) March 20.

We are glad to receive indications, in various parts of the state, of an increasing attention of the citizens to the deleterious operation of our present collection laws. It is difficult to conceive a system more unjust in itself, or more demoralizing in its consequences, than that now in force for the collection of debts. When the consequences resulting from it are viewed with candor, it is believed there is sufficient virtue and intelligence in the great body of the people to effect a repeal of a law so disgraceful to the statute book. We copied an article from the Warren paper, last week, showing the kind of property the creditor is obliged to receive for an honest debt; or at least, he has only *Hobson's choice*—"this or nothing." And this too, is authorised by a legislature, the members of which are sworn to support a constitution which forbids them to pass any "*law impairing the obligation of contracts.*" The following is a list of articles, with their appraised value, sold out to satisfy an execution in favor of a citizen of this place, by a person living in Middleburg, in this county.

A quantity of rails	$9 00
2 deer skins	1 44
1 horse sled	2 00
1 grindstone	3 00
1 ladder	0 50
1 leach tub	0 25
2 benches	0 95
8 barrels	4 00
1 dog	10 00
1 watch	20 50

The plaintiff was obliged to take the above articles at half their praised value, (which is probably ten times as much as the *honest* appraiser or any one else, would give for them) or wait six months, and then perhaps be no nearer obtaining his just demand than before. This is the common operation of the law "regulating judgments and execution;" and we might, with much propriety, be entitled, *An act authorizing and regulating the practice of swindling.*

The following article, on this subject, has accidently fallen into our hands; and, though somewhat dated we have thought it worth the pains of decyphering, in order to present it to our readers. It appears to have been written by some man or body of men for some purpose for which it has been applied: but it contains too much truth and sound reasoning to be lost.

"We are fully persuaded that the operation of our "collection laws" is the most ruinous, both for debtor and creditor, that can be devised, and destructive to the morals and character of the state.

"We complain of a want of circulating medium. Our laws, by necessary consequences, drive away the greater part; at the same time, they make it necessary, for transacting the same business, ten times the quantity and wise and equitable arrangement would require. For, money will find a place where it can be the most serviceable; and if one dollar can be made pay ten debts, which it now pays but one, it answers the same purpose as a circulating medium, that ten dollars.

"But a wise people, who wish to transmit their civil and religious liberties to their children, will always regard, with watchful eye, the moral and immoral influence every act has upon the community. Whatever, therefore, in any way encourages perjury and fraud, and tends to destroy the nice sense of justice and honor, so essential to the dignity of man, must always tend to the misery of the community, and jeopardize the liberties of any people.

"It is a fact, that *fire wood, sawlogs* and *rails in the woods, grindstones, old log houses*, and *hog pens*, have, within the last year, been "turned out in execution" as property, and frequently appraised at more than four times and in some instances more than a hundred times, their real value. This in one act, *farther embarrassing and involving the debtor, injuring the creditor, corrupting the appraisers, and spreading moral and political disease and death among the community.* A free people will not long remain in the same error but, after one extreme, there is always danger of vibrating to the opposite—and less vice has so corroded public sentiment as to destroy its elasticity. Against these extremes, and the *causes* of them a wise people will sedulously guard.—*Herald.*

GOSHEN, (N. Y.) MARCH 26.

Great Day's Work.—On the 9th inst. James F. Green dressed out for James D. Clark, of the town of Warwick, *one hundred and one and a half* pounds of Flax. This is the greatest day's work at dressing flax we have ever heard of.

DOC'R. FOWLER,

Offers his professional services to the inhabitants of Charlestown and its vicinity. His Medicinal Store is on Main-street, second door south of Messrs. HARPER and NORRIS'.

☞ He will keep for sale a General assortment of Family and Patent MEDICINES.

CHARLESTOWN, MAR 3, 1821.
