Take ICE the year round

SEPTEMBER 1922

SEPTEMBER is a hard month on food

At this season the parasites of decay are very active. Vegetation dies; fruits ripen and rot. Disease germs abound. And people get careless. In the heat of midsummer unchilled food spoils so quickly that to save it at all people have to keep the refrigerator well iced. In fall the heat is less intense and less prolonged and that puts people off their guard. They forget that some days are hot even when the nights are cool.

They also forget that unless food is kept chilled all the time it will spoil just as surely on a warm day as on a hot day, but not quite so fast. Whatever the temperature may be outdoors—hot, warm or cool—the temperature in your ice box should always be the same—that is ice cold. Otherwise your milk, meat, butter and eggs will not keep. Bacteria breed above a certain temperature—about 50 degrees for most foods, and at 60 degrees they breed very fast. That starts decay.

If September proves a hot month, you will use a lot of ice and must have it; if it turns cool you will use but little ice to keep your refrigerator ice cold. You don't have to think of the weather. Keep your ice chamber filled. That will protect your food all the time and cost you only what the weather may melt.

It is both wasteful and unsafe to let your ice get low because the weather is a bit cooler.
